SCIENTIFIC SERVICES - CAPE TOWN

The Pangea Group of companies has made use of the laboratory services of Scientific Services for more than 20 years. Quality of work done by Scientific Services is of a very high standard and we are always able to depend on consistent accurate data. For each deposit type evaluated Scientific Services have provided sound advice and guidance on the best geochemical methodology to give acceptable detection limits and precision on analyses.

Work undertaken for the Pangea Group of Companies varied from small once-off jobs to large geochemical exploration programmes over a number of years. This has included analyses related to mineral sand, gold, copper and diamonds deposits.

The discovery of three gold mines in Tanzania (Tulawaka, Golden Rigde and Buzwagi, now the property of Barrick Gold Inc) and a number of new gold discoveries in Central African Republic can all be directly accredited to excellent gold analysis done at Scientific Services. Likewise we have used the laboratory for various types of assays related to the search for mineral sand deposits in Africa and South America. Most notable has been the discovery and evaluation of the Corridor Sands deposit in Mozambique, now being developed by BHP.

As long as excellence in competence, accuracy and skill remain key priorities of Scientific Services Laboratories, Pangea will continue to use these services in the quest for new mineral discoveries and mines.

Anton Esterhuizen
Managing Director
